

## How to Project your iPad in a Smart Classroom using VGA adapter

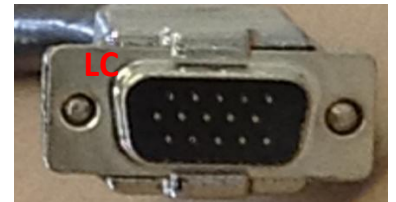

1. You will need a white Apple VGA Adapter cable. It provides a small flat connector (A) on one end and a 15-pin connector (B) on the other end.

2. Locate the Laptop Connection (LC) cable on the Instructor desk. It should be sitting on the desktop near the control panel. If not, check to see if it is on the floor. It is a black or silver 15-pin VGA connector.

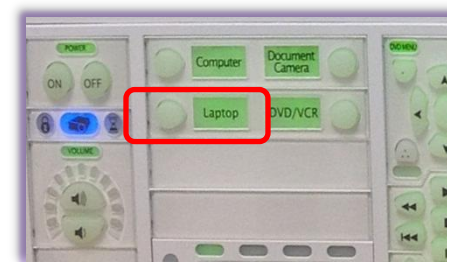

3. Connect B to LC. Make sure the wider side of the trapezoid is facing up on both connectors.

4. Connect A to your iPad port in the middle of the bottom edge, below the Home button.

5. Locate the Control Panel, either on the wall or built into the desktop. Select the LAPTOP button.

Note: Make sure the iPad is fully charged before hooking it up to the projector. For further assistance, please contact the Helpdesk at extension 7109.
